“Options” to prevent dangerous over Vaccination

1. Titre Test

No pet should ever be re-vaccinated, not ever, without a “Titre test“ to see if its actually needed.

Dr Edward (Australian vet) … says "Seroconversion (is the time period during which a specific antibody develops and becomes detectable in the blood) and titre testing is well and truly validated scientifically (and is definite proof of positive disease protection status after vaccination, no matter what age the puppy, kitten or dog, cat in question - and the chances of a false positive are very, very low)". Some vets who send them away charge a hell of a lot for it though, way too much.

* Ask your vet to order the Biogal brand VacciCheck in house titre test kit.

Biogal brand - VacciCheck® Antibody Test Kit  [is a new method] which is a simple and affordable in-clinic titer test designed to monitor serological status and vaccination failure to prevent over vaccination consequences. VacciCheck provides reliable and accurate results in just 21 minutes! AVAILABLE by request from a Vet Clinic. Push your Vet into having this type of in-house titre testing available.

Find a supplier in your Country  http://www.biogal.co.il/find-distributors

Find a Vet who is willing to help you provide the safest inexpensive way of keeping your pet well.

If your pet has seroconverted, no matter what their age, they do no need another vaccination. Nor do they need a 'booster' at a year old, as they already have long lasting immunity. Dr Edwards has titre test puppies 2 weeks after initial vaccination, if it’s positive then they need no more vaccinations (So - any dog or cat, of any age, can be titre tested 2 weeks after any C3 vaccination. If your puppy is going to respond, it will have by then. He has titre tested several puppies after their first vaccination like this, and they've had strongly positive titre levels. Any further vaccinations for these puppies (or kittens) would have been completely unnecessary, and may have caused the puppy in question harm.

The whole 'booster' thing is really a false way to describe it - nearly all the so-called 'booster' vaccinations administered to our pets are completely unnecessary. no difference what country you live in, either.

Weakness in joints and spine which cause Inflammation and pain in joints, spine area can be often associated with a vitamin or mineral deficiencies. Thus continued vaccinations that severely deplete vitamin c and magnesium (stress), will make your dog more susceptible to injuries and tears.

Vitamin C is an anti-inflammatory that helps reduce and prevent inflammation and swelling. Research has shown that high doses of vitamin C given orally or in meals has been shown to reduce the production of pro-inflammatory cytokines. We have had great improvement seen, when vitamin C is restored back into the body.
Over vaccinations will severely deplete the body of Vitamin C. Just to bring this awareness to you, if you have recently allowed a vet to give your pet a vaccination (over vaccination), then this would be the cause of such pain now. Unfortunately your vet will not associate this pain - acute There is no need for a so-called 'booster' vaccination a year after the puppy or your kittens vaccinations.

NO PET SHOULD EVER BE RE - VACCINATED, NOT EVER, WITHOUT A TITRE TEST TO SEE IF IT'S ACTUALLY NEEDED. It makes or chronic - (or should we say admit) that many health joint, skin disease conditions are from side affects of vaccinations. Dr Ronald Schutz's research around duration of immunity for C3 (Dog) and F3 (Cat) vaccinations has been around for ages - and is only a short google away from anyone.

2. Canine and Feline Oral Nosodes

Nosodes are specialized homeopathic remedies that are prepared by taking actual diseased matter from a sick animal such as diseased tissue or nasal discharge. The preparation of a nosode involves a lengthy process of succussion and dilution of the original material using traditional homeopathic protocols until virtually no molecules of the crude substance remain, rendering the nosode safe for use. This process, called potentization, inactivates the original disease substance and converts the material into a bioenergetic remedy which interacts with the body's energy field. The final product is a potent remedy that is an energetic blueprint of the actual disease.

What are Nosodes?

- Human Nosode Research
  Dr. Isaac Golden, an Australian homeopath, has done extensive research in the field of homeopathic childhood immunizations. Working directly with families who agreed to participate in a clinical trial of typical childhood diseases, Dr. Golden concluded that homeopathic immunizations were 90.4% effective. From 2001 to 2004, Dr. Golden also studied vaccine safety compared to homeopathic immunizations. He found that children who received standard vaccines were 15 more times likely to get asthma, 7 times more likely to get eczema and 2 times more likely to get allergies than those who were immunized by homeopathic preparations. His work is published in his ground breaking books, Vaccination and Homoeoprophylaxis: A Review of Risks and Alternatives, and Homoeoprophylaxis: A Ten Year Clinical Study.

- Homeopathic Immunization in Dogs
  Dr. Christopher Day, British veterinary homeopath, has been using nosodes in his practice for 35 years. Evidence of reduced rates of distemper, hepatitis, leptospirosis, parvovirus and kennel cough has encouraged him to recommend nosodes to his clients for prevention and treatment of disease. In 1985, Dr. Day documented the successful use of nosodes in a kennel cough outbreak.

  The trial was done in a day care and there were 214 dogs participating, including both vaccinated and unvaccinated dogs. The nosode was introduced by placing it in the dogs drinking water. Remarkably, out of a total of 214 dogs that were treated with the kennel cough nosode, the incidence of actual, full-blown disease was only 1.9% out of 214 dogs, and the majority of dogs who did contract kennel cough exhibited only minor symptoms. The vaccinated dogs had a higher incidence of disease at 4.7% whereas only 0.7% of the unvaccinated dogs showed symptoms. Minor symptoms were expressed by 42.5% of the dogs, with 59.7% of vaccinated dogs showing minor symptoms, compared to 26.7% of unvaccinated dogs. This study shows that nosodes can be effective in disease prevention, and when dogs do contract disease, the severity of symptoms can be reduced with their use.
The nosodes do not produce a titer response.

Homeopathics oral nosodes are non chemical safe medicines, therefore, they do not show up in the blood. Where as the titre test is done for pets that have had a live virus injected into there body, and this will show up in the Titre test. You really don’t need a titre test once you rely on the canine oral nosodes immunizations.

If your pet has previously had a vaccination then:

Instead of vaccination injections, if you are unsure about continuing vaccinations or not, ask instead for a Titer test (anti bodies immunity test). Every time you get this test done it will show you that your pet is still fully immunized for all disease.

Warning: Dangers of HEAVY METALS IN VACCINE.

Thimerosal (mercury) - an organic compound containing the heavy metal mercury, which has been widely used as a preservative in vaccines. Mercury is a powerful neurotoxin. It is one of the most potent poisons known to man and has been shown to impair the function of many internal systems, chief among them being the brain, the central nervous system, the endocrine system, and the kidneys, as well as other organs.

Aluminium - another heavy metal used in vaccines as an adjuvant. Adjuvants are often added to vaccines containing killed viruses in order to enhance, or boost the vaccine's effectiveness. Aluminium is a known neurotoxin.

Formaldehyde - classified by the EPA as a probable carcinogen, is used as a tissue fixative in some vaccines. Metals, such as aluminium and mercury, affect the brain and the nerves causing seizures, dementia, hyperactivity in the young pets and brain dysfunction (dementia) in the aged. All organs are susceptible, especially the gastro-intestinal tract, kidneys, liver and the bone marrow. Toxicity may not be apparent for many years until debilitating nerve disorders become apparent, at which stage, it may be too late. Prophylactics are homoeopathic remedies used for disease prevention.

Side effects from vaccines will produce a toxic build-up which may be the reason for unexplained symptoms such as (when before vaccine you had a healthy pet):

Lack of energy,
vertigo,
headaches,
numbness,
pins and needles,
muscle weakness,
neuralgia,
behavioural changes,
hyperactivity,
learning disability,
depression,
insomnia,
irritability,
anæmia,
hypertension,
abdominal pains,
loss of weight,
asthma,
allergies,
skin disorders,
weakened immunity system.

If you happened to have a pet that has a chemical sensitivity, then your pet will have acute and sometimes fatal reactions - within 2 days or same day of injection.
Vitamin C is also given along with homeopathic vaccine toxins for detox - can sometimes prevent many side effects.

**Warning:** Lyme vaccine can cause neurological damage and aggression misdiagnosed as rage syndrome. Sudden, serious aggression in a previously well-mannered dog can be a reaction to Lyme vaccine. When it happens to dogs vaccinated in a diligent rescue facility, it is especially tragic.

Dr. Jordan’s rescue case history and the dog bite statistics below are connected. Remember this information when a friend confides in you that their dog has become aggressive. If it is Lyme vaccine related, it is tragic but having to destroy a beloved pet due to lack of knowledge and foresight is an even worse tragedy. Inexplicable aggression called Rage Syndrome in Springer Spaniels was attributed to an inherited flaw introduced by an outstanding English import back in the 80s. Today we would say that dog’s ”rage syndrome” was caused by having received a full battery of vaccinations, from rabies vaccine to Lyme vaccine, just prior to export. As 2013 draws to a close, we can state that “rage syndrome” affects all breeds, from Golden Retrievers to Yorkies!

**Use the Lyme Oral Nosodes**

**Human Nosode Research**

Dr. Isaac Golden, an Australian homeopath, has done extensive research in the field of homeopathic childhood immunizations. Working directly with families who agreed to participate in a clinical trial of typical childhood diseases, Dr. Golden concluded that homeopathic immunizations were 90.4% effective. From 2001 to 2004, Dr. Golden also studied vaccine safety compared to homeopathic immunizations. He found that children who received standard vaccines were 15 more times likely to get asthma, 7 times more likely to get eczema and 2 times more likely to get allergies than those who were immunized by homeopathic preparations. His work is published in his ground breaking books, ‘Vaccination and Homeoprophylaxis: A Review of Risks and Alternatives’, and ‘Homoeprophylaxis: A Ten Year Clinical Study’.

**Vaccine injections (or nasal spray vaccine)**

Many orthodox veterinary practitioners are still vaccinating animals annually with multi-strain vaccines despite the obvious study results published by many veterinary researchers that the immunity against these pathogens from a single vaccine last more than a year. If puppies and kittens are vaccinated according to the new principles of immunization, which is to vaccinate healthy animals with core vaccines at 8 weeks old and subsequent injections given 4 weeks apart until 16 weeks of age, followed by annual booster, will provide lifetime immunity. Researchers have also shown that Canine Parvovirus, Canine Distemper virus and Canine Adenovirus vaccine has minimum duration of immunity of 7 years or lifetime.

**In cats, Feline Panleukopenia virus Feline Herpes virus vaccine** will produce immunity of 5 to 6 years or for lifetime. Immunity against Canine and Feline Rabies vaccine has shown to last at least 3 years despite legal regulation to vaccinate annually against Rabies in some states in the United States. Thus annual vaccination is not necessary as research findings state that revaccination with viral vaccine fails to stimulate anamnestic response as a result of interference of existing antibody.

Dr. Ronald Schulz, a veterinary immunologist at the University of Wisconsin School of Veterinary Medicine, has done experiments to show that immunity from vaccine last more than just a year. Dr. Schulz exposed fully vaccinated adult dogs to pathogenic Parvovirus, Rabies, Canine Distemper virus and Parainfluenza virus at 3 years, 5 years and 7 years post vaccination, and found all of them remained healthy. Furthermore, measuring immunity levels of these dogs at 9 and 15 years post vaccination revealed sufficient antibody levels to prevent the diseases. Various antibody titers may be determined, including ELISA antibody titer test and viral neutralizing (VN) titers also referred to as “serum neutralizing” (SN) antibody titers. VN antibody titers against Feline Panleukopenia virus, Feline Herpes virus and Calcivirus can be measured but the correlation between serologic titer to a specific infectious agent and protection against that infectious agent...
has been thoroughly established for Feline Rhinotrachitis viruses. A negative titer does not necessarily correlate with a lack of protection to subsequent exposure.

Many holistic animal practitioners and veterinarians believe that vaccines do more harm than good to animals' health. Not only annual booster vaccines are ineffective to mount an anamnestic immune response due to neutralizing effect by the existing antibodies, both attenuated and live vaccine causes harmful side effects. The route of vaccines given to animals are usually via subcutaneous or intramuscular which killed or attenuated virus components are introduced into systemic circulation which is an unnatural way to introduce pathogens to the immune system. Vaccination avoids the immune response to be triggered normally, presence of millions of viral particles in the system without warning leads to abnormal immune reaction. This process weakens or creates imbalance in the immune system and bring about a major stress to animal's health. The consequences are more pronounced in juveniles, sick patient or geriatric animals.

Vaccines cannot stimulate adequate immunity in the presence of conditions that compromise the immune state. Such conditions include young animals with underdeveloped immunity, sick patients, concurrent drug therapy and stress. In these situations, either the immune system may be unable to mount an adequate response or adverse reaction may occur.

The adverse reactions, presented either short or long term, are often referred to as vaccinosis and miasms, which is said to be difficult to cure. One of the acute onset adverse reactions to vaccine are anaphylaxis and the development of fibrosarcoma at the injection site. Anaphylaxis is a life threatening, immediate systemic allergic reactions results in respiratory distress and vasculogenic shock, commonly associated with killed vaccines.

Dr. Christopher Day believes that 80% of the chronic diseases can establish in just 3 months post vaccination event. Holistic veterinarians have observed hundreds of ill animals with wide range of organ dysfunction, chronic skin problems, immune depression diseases, allergies, kidney failure and heart disease.

Canine Distemper virus and Rabies virus are known to cause an inflammation of the brain or paralysis. Some animals will chase imaginary objects in the air, snapping jaws in the air at nothing, or personality change from loving dog to a snaring beast. We have found that organ and nervous system would not return to normal until all of the Rabies vaccinations in the animal were removed. We have also found that Rabies, Canine Distemper virus and Aluminum, an adjuvant carried in attenuated vaccine, to cause skin problems, endocrine deficiencies, allergies and tumor.

Cancer is one of the detrimental adverse effects of vaccination. During the process of vaccine manufacturing, cell cultures are rendered immortal in their development, using hybridization of normal cells with immortal tumor cells. The DNA carried in the vaccine from these cultures may be carcinogenic via expression of dominant activated oncogenes when introduced in recipient cells or via integration of these DNA with the host genome to form a cancer phenotype. Dr. Charles E Loops is observing increasing number of fatal cancer cases in dogs as young as 3 years old. One statistic showed that 50% of dogs in United States contract cancer by the age of 3.

Many researchers are now looking into vaccines causing immune-mediated diseases, producing autoimmune antibody to attack its own organs and body tissues. These diseases include; immune-mediated hemolytic anemia, hypoadrenocorticism, hypothyroidism, kerato-conjunctivitis sicca, pemphigus and eosinophilic granuloma, exocrine pancreatic insufficiency, diabetes mellitus and endocardiosis. Moreover, there is an emerging finding that conditions which believed to be hereditary or genetic in origin as a result of breed predispositions may be influenced by vaccination.

What Vet Clinical symptoms that can occur following vaccinations?
Vaccination, a homeopathic term used to describe illnesses and death caused by the vaccine virus, can occur following vaccinations. Vaccines not only contain genetically modified virus components, toxic metals such as aluminum or mercury, toxic substances such as formaldehyde, phenol, methanol or isopropylalcohol and other unknown ingredients that manufacturers are not labeling on
the vaccine are included in vaccines. Another concern lies where vaccine is not dose dependent. Both Chihuahua and Great Dane receive the same dosage of vaccine despite the size difference and components of vaccines including toxic materials are dose related and will likely to cause adverse reactions in a smaller animal. Commonly, mild fever, inappetence, depression or irritation at the injection site are seen up to 3 days post vaccination.

~ More serious adverse reactions are **Anaphylaxis** and **fibrosarcoma** ~

**Anaphylaxis** occurs within minutes to hours and common clinical signs include acute onset of diarrhea, vomiting, facial edema, vasculogenic shock, seizures, coma and death. Anaphylactic patient requires immediate attention and treatment. Local reactions at the injection site can occur and sometimes it can develop into an abscess or **fibrosarcoma** due to autoimmune reaction to the vaccine. Other reactions include meningitis due to Distemper vaccine, uveitis due to Adenovirus-1, and birth defect when a modified live vaccine is given to pregnant animals.

**Homeopathic nosodes** are available for all common diseases such as Canine Parvivirus, Canine Distemper virus, Kennel cough, Feline Panlukopenia, Feline Rhinitrachitis and Rabies. A nosode is a homeopathic remedy made from infective excretions, and secretions from an infected patient: feces, urine, pus, blood, hair, saliva, spinal fluid, necropsy tissue section of an organ or growth showing pathology. It provides oral protection against that specific disease producing infective agent and they are given at the time of exposure. When taken orally, entire reticuloendothelias system is incorporated which resembles `street infection' where immunity is stimulated in a natural way. Nosodes provide more solid immunity than traditional vaccine but it does not produce titers against the disease. Nosodes, just like vaccines, should be given to healthy animals only and used with care however, nosodes have more advantages than orthodox method. Nosodes can be given to puppies and kittens younger than 6 months old as it does not interfere with maternal antibodies, it can strengthen the vital force of these animals. Nosodes produce a broad-spectrum protection against many infective strains of viruses, which are not genetically related.

**WHAT IS THE HOLISTIC PERSPECTIVE?**
A healthy animal or person is unlikely to get sick (or very sick) even if exposed to infectious agents. Ideally we would never vaccinate, feed wonderful fresh food and treat the early symptoms that indicate the body is out of balance. (See sheet on the early warning signs of energy imbalance.) If they do develop an infectious disease, it can usually be treated successfully with homeopathy. Vaccinating an animal does not necessarily protect them from the very diseases for which they are vaccinated, and can make them weaker overall. Dr. Schultz, veterinary immunologist at the Wisconsin Veterinary College, tested 6 Parvo vaccines and found only 2 to be at all effective - now the companies have improved them all.

**ARE ANNUAL VACCINATIONS NECESSARY?**
Drs. Schultz & Phillips (Scripps Institute) write in Kirk's Current Veterinary Therapy, Vol 11, page 205, saying "A practice that was started many years ago and that lacks scientific validity or verification is annual revaccinations. Almost without exception there is no immunological requirement for annual revaccination...The practice of annual vaccination in our opinion should be considered of questionable efficacy...." Dr. Schultz vaccinates his dogs as puppies for only distemper and parvo, then only Rabies the rest of their lives. Even Rabies vaccine is probably good for more than 3 years, since it is a viral vaccine. The tests done by the vaccine manufacturers on the required 7 dogs (only 7), were carried out only at three years post vaccine. If they had tested dogs longer post vaccine, rabies may be good for life

**ARE VACCINATIONS POTENTIALLY HARMFUL?**
Holistic veterinarians are finding that vaccines are causing great harm to our animals (and ourselves). To cure an animal we must use homeopathic remedies known to reverse vaccine related problems. Often, if vaccinated during treatment, the progress we are making is stopped. Conventional veterinarians are also reporting health problems due to vaccinations. "Immune-mediated hematologic disease and transient bone marrow failure are increasingly recognized sequela of...vaccination. ... Postvaccinal polyneuropathy is a recognized entity associated with...vaccines.
...Adverse reactions to vaccination have also recently been reported with increasing frequency in cats.” (Dr. Dodds, 1990) Other reports include: immunologic disorders (Frick, Green, McDonald, Phillips & Schultz, Tizard); adverse vaccine reactions (Green, McDonald, Phillips & Schultz, Tizard, Wilford); increased sensitivity to pollen antigens after vaccination (Frick, Dodds). See vaccination bibliography for more information.

Many ferrets with green diarrhea (which started after a distemper scare caused much increased frequency of vaccination) were successfully treated with Thuja. The inserts that come with all vaccines say to use them only in healthy animals. So if you are taking your animal to a clinic or a kennel and there is not great health, then the vaccines should not, according to the manufacturer, be used at that time. Many of my clients have told horror stories of the illnesses they feel occurred after their animals were vaccinated. Some problems were immediate, but most were slower onset. A veterinarian who breeds and shows Collies tells of breeders who start vaccinating at 2 weeks of age with modified live multiple vaccines. She has noticed for years that these are puppies who have the most lamenesses, the most bloat, the most skin parasites and the most breeding problems. She has avoided them for years.

IS THERE ANY RESEARCH ON HOMEOPATHIC PROTECTION?

Although homeopathic prevention has been used for many years, especially in Europe, it is not yet a standard approach and must be considered as experimental. Christopher Day, a homeopathic veterinarian in England, has shown very good evidence of protection by homeopathic vaccines in kennels with endemic kennel cough. He, and other homeopathic veterinarians have rarely had animals they protected with nosodes become ill with those diseases and definitely find that these animals have a much lower incidence of illnesses of any kind. Dr. Christopher Day's study is reported in the IAVH journal 4/87. Briefly, an outbreak of Kennel Cough in a kennel of 40 dogs showed that the use of vaccination was not effective. Eighteen of the 40 dogs had been previously vaccinated with PI3 & Bordetella before the outbreak. Every one of the vaccinated dogs became ill with a cough (100%) while only 19 of the remaining 22 unvaccinated dogs developed symptoms (86%). The symptoms were severe. The owners decided to try the Kennel Cough Nosode (homeopathic). Over the next several months a total of 214 dogs were treated and observed. The results show that, after use of the nosode, the incidence of Kennel Cough decreased to 4.7% in the previously unvaccinated dogs.

Other research on nosodes is currently being conducted in the United States. Funding is needed. Most homeopathic practitioners will certainly work with your animals regardless of your choices about vaccination, even if you elect to fully vaccinate them. I think this is an important issue to grapple with, and encourage you to read some of the following information, and listen to lectures by people like Dr. Ron Schultz or Dr. Jean Dodds. (Several good ones are available from the 1995 AHVMA annual conference.

BIBLIOGRAPHY FOR VACCINATION RESOURCES

**Australian Boarding Kennel List**

The following list of Kennels are happy to board your Dog/s & Cat/s, who have been fully immunized with the natural homeopathically prepared Feline and Canine Oral (Nosode) Vaccine Immunization’s only.

Hi Animal Lovers!

We would love to add more to this list. If you have a favorite kennel that you would like for us to contact them or they would like to be our list please emails use with details. thank you, HAMPL Management

All kennels listed accept the homeopathic alternative oral nosodes immunized pets to the vaccine injections.

**NOTE:** These Kennels get booked out quickly in the ‘Holiday periods’, you will need to book many months in advanced.

Alternatively - “House Sitters” Which is a FREE in-house home & pet sitting service.

AUSTRALIA WIDE [www.housesitters.com.au](http://www.housesitters.com.au) (This is just one, as there are other sitters on the websites -google search)
